Continuation of 11. does NOT place the application in condition for allowance because the applicant's arguments are not persuasive. The applicant argues that Banys fails to teach a method of using a radiopaque feature for determining or measuring displacement from a lumen of any cutting device. The applicant also argues that Banys fails to teach an endoscope catheter and tissue cutting device extendable from a catheter lumen. However, as shown in Fig. 3, Banys indeed teaches a catheter having a lumen that is fully capable of receiving an endoscope. Furthermore, Banys teaches a needle 16 (Fig. 2) that is inserted into the catheter tube 44 (Fig. 3). Banys teaches that needle 16 includes radiopaque material to locate the needle next to the target tissue. Locating the needle next to the target tissue would displace the needle within the catheter tube, which would inherently provide a measurable displacement length that is measurable. Thus, the method of moving a radiopaque needle within the catheter to locate the needle next to a tissue would inherently teach the method of using a radiopaque material for determining displacement of a cutting device (needle) from a catheter lumen. The Pacetti reference is then used to provide teaching of using a plurality of radiopaque markers on a needle (biopsy needle, which is what Banys teaches).
